"Hi, my name is Jay Clifferson P. Arevalo! But you can call me Jay. Im currently 21 years old and my birthday is at February 21, 2005 I currently live on Luzon Avenue in Commonwealth. The things I'm passionate about are drawing anime and spending time reading manga and manhwa. In my free time, I also enjoy staying active by exercising. Some of my favorite include A Silent Voice, The Greatest Estate Developer, Your Throne, The Daily Lives of High School Boys, and my life as a up student with my The Fragrant Flower Blooms with Dignity, among many others.

I chose to pursue a degree in BS Information Technology because I'm fascinated by both the creative and technical aspects of software development. Michael Reeves, one of my biggest inspirations, really showed me how coding can be both fun and innovative, offering unique ways to solve problems Ultimately, my goal is to become a software engineer and contribute to developing exciting and impactful technology."

3 words to describe me are CHAOTIC, GRITTY, YEARNER

My impression to our teacher is that he has a really playful soul and that he goes to live life finishing jobs first and then he can go on her day. He as a fellow learner just jives in and has few laughs here and there I like his vibe since he reminds me of my friend who's always oh so lucky and is just a joy to be around. I know for a fact that he won't let us down and that this will be a joyful experience for the both of us. Furthermore with Java now creeping in I think that our professor would not let us down on to learning about it.

PERSONAL GOALS THIS YEAR ON COMP 009 | OBJECT- ORIENTED PROGRAMMING

1. Core Motivation

This year, my primary goal is to deepen my understanding of Object-Oriented Programming (OOP) and how it is applied in real-world systems. I want to move beyond just writing code and really grasp the principles of abstraction, encapsulation, inheritance, and polymorphism – the foundations that make modern software scalable, reusable, and secure.

2. Mastering OOP Concepts

A major area that I want to focus on is how OOP principles translate into practical coding. Specifically, I aim to strengthen my knowledge of is first Classes and Objects: Designing blueprints that represent real-world entities. Second is Encapsulation: Protecting data by controlling access through methods. Third is Inheritance: Reusing and extending code efficiently. Last but not the least is Polymorphism: Writing flexible code that adapts to different scenarios. Essentially I just want to understand not just the syntax but also the design patterns and best practices that make OOP powerful in large scale or even personal applications.

3. Information Security and Governance in OOP

Beyond coding mechanics, I also really want to explore how OOP supports data security and governance. This includes the following first is Access Modifiers: Using private, public, and protected attributes to safeguard data. Second is Error Handling: Writing robust programs that anticipate and manage failures. Third is Design Principles: Applying SOLID principles to ensure maintainability and reliability. So With this in mind by connecting OOP with governance and security, I'll learn how structured code can protect sensitive information and support organizational standards which will really be helpful in me finding jobs since the Job market is cooked.

4. Application to Capstone Project

All of these skills will directly support my Capstone Project. My vision is to build a file management system that uses OOP principles to automatically organize downloaded files. For example: May this be Converting and filing YouTube videos into MP3 format. Even Managing Tachiyomi files for manga readers. Also even Creating classes and methods that categorize and store files automatically, reducing manual effort. This projects of mine will combine technical knowledge with real-world usability, aligning perfectly with the principles of Human-Computer Interaction (HCI) as well so its hitting two birds with one code. EH get it? Get it? Ok I'll leave...

5. Long-Term Value

By pursuing these goals, I will:

One, Strengthen my technical foundation in Object-Oriented Programming.

Two, Gain practical skills in secure, maintainable software design.

And Lastly Three, Build a project that demonstrates both technical competence and user-centered design.

In conclusion this journey of mine will prepare me for professional challenges in IT while allowing me to contribute meaningful solutions to everyday problems and I thank you! (Applause encore!)
