

Jay Clifferson P. Arevalo

BSIT 2-3

Mid term Seedwork #2 - Smart Wallet System

No. 2nd Sem
Date 3/25/2026

Create a Java Program that simulates a digital wallet system with transaction tracking

Program Requirements

1.) Create a Java program named: Smart Wallet System/Last Name

(Example: Smart Wallet System Arevalo)

2. Assume the initial balance is:

5,000 pesos

3.) Display the following menu:

===== SMART WALLET MENU =====

1. View Balance

2. Cash in

3. Send Money

4. Exit

Additional Requirement

- Count & display the number of successful transactions only

Important Conditions

Send Money Rules:

- Minimum amount: 100 pesos
- Maximum per transaction: 1,500 pesos
- Do not allow transaction if:
 - Amount is less than 100
 - Amount exceeds 1,500
 - Amount exceeds current balance

Program Rules

Your program must use:

- While loop (continuous process)
- Switch-case (menu selection)
- if-else (validation rules)
- Transaction counter
- Scanner class

Handwritten Requirement

The Java program must be written neatly by hand on paper

Follow these rules:

- Use clear & readable handwriting
- Observe proper indentation & spacing

2.) Sample Execution (at least 3 scenarios)

Example: Transaction 1:

Choice: 1

Output: Balance = 5000

Transaction 2:

Choice: 2

Cash in: 2000

Output: New Balance = 7000

Transaction 3:

Choice: 3

Send Money: 2000

Output: Exceeds maximum limit

Transaction Count: 2

5. Submission Format on Canvas

Section_LastName_FirstName_SmartWalletSystem.pdf or docx

6. Academic Integrity Policy

Students must write their own program.

Strictly prohibited:

- Copying code from classmates
- Sharing Code
- Downloading solutions online

Identical output / code may result in a score of 0.

3. Short Explanation (3-5 sentences)

Explain:

- How the while loop keeps the program running
- How Switch Case controls menu selection
- How if-else validates transactions

7. proper format:

Write at top of your paper:

- Name
- Section
- Date
- Activity Title

The Java Program

No. _____

Date _____

```
import java.util.Scanner;
```

```
public class WalletSystemArevalo {  
    public static void main (String[] args) {  
        Scanner inputDevice = new Scanner (System.in);  
        double currentFunds = 5000.00;  
        int transactionCounter = 0;  
        boolean keepRn = true;  
  
        while (keepRn) {  
            System.out.println("\n===== SMART WALLET MENU=====");  
            System.out.println("Transaction counter: " + transactionCounter);  
            System.out.println("1. View Balance");  
            System.out.println("2. Cash In");  
            System.out.println("3. Send Money");  
            System.out.println("4. Exit");  
            System.out.print("Enter your choice: ");  
  
            int menuOption = inputDevice.nextInt();  
  
            switch (menuOption) {  
                case 1:  
                    System.out.println("Balance = " + currentFunds);  
                    break;  
  
                case 2:  
                    System.out.print("Cash In: ");  
                    double depositAmount = inputDevice.nextDouble();  
                    transactionCounter++;  
                    if (depositAmount > 0) {  
                        currentFunds += depositAmount;  
                    }  
                }  
            }  
        }  
    }  
}
```

```

        System.out.println("New Balance = " + currentFunds);
        System.out.println("Transaction Count = " + transactionCounter);
    } else {
        System.out.println("Invalid cash in amount");
        System.out.println("Transaction Count = " + transactionCounter);
    }
    break;

```

Case 3:

```

System.out.print("Send Money: ");
double transferAmount = inputDevice.nextDouble();
transactionCounter++;

```

```

if (transferAmount < 100) {
    System.out.println("Amount is less than minimum limit of 100");
    System.out.println("Transaction Count = " + transactionCounter);
} else if (transferAmount > 1500) {
    System.out.println("Exceeds maximum limit.");
    System.out.println("Transaction Count = " + transactionCounter);
} else if (transferAmount > currentFunds) {
    System.out.println("Amount exceeds current balance");
    System.out.println("Transaction Count = " + transactionCounter);
} else {
    currentFunds -= transferAmount;
    System.out.println("Transaction Successful! New balance is = " + currentFunds);
    System.out.println("Transaction Count = " + transactionCounter);
}
break;

```

Case 7:

```

System.out.println("Final Transaction Count: " + transactionCounter);
System.out.println("Exiting System...");
keepRun = false;

```

break;

default:

System.out.println("Invalid choice. Try again.");

}

}

inputDevice.close();

}

}

Short explanation :- ~o ~o ~o ~o ~o ~o ~o ~o ~o ~o

Upon my own understanding is that the while loop keeps the program running continuously, allowing the user to perform multiple actions until they will choose the "Exit" option. Then the switch-case statement efficiently directs the program's flow essentially matching the user's numeric input to their corresponding menu action, such as viewing the balance or wanting to cash in. At last finally, if-else statements are then used to validate transactions, ensuring that the constraints such as the minimum 100 peso limit & the 1500 maximum limits are then met before deducting from the balance.
